# A Guide to Maximizing Your Signal Workflow with B/C Signals

Welcome to B/C Signals! This guide will walk you through the bot's powerful features, showing you how to take full control of your trading signals.

## See Your Performance Instantly with /stats

- **What It Does:** The /stats command gives you a real-time snapshot of your trading performance for the day.
- **What It Means For You:** No more guessing or opening spreadsheets. At any time, you can see your total signals sent, your win/loss count, and your total Profit & Loss (P&L) for the day, all in one simple, clean message.

## You're Always in Control with /pause and /resume

- **What It Does:** These commands let you instantly stop or start the bot from processing any new signals.
- **What It Means For You:** You have an "emergency stop" right in your pocket. See a big news event coming, or just want to take a break? Use /pause to safely halt all activity. When you're ready to trade again, /resume gets you back in the game instantly.

## Adapt Your Strategy on the Fly with /set

- **What It Does:** The /set command opens a simple, step-by-step menu that lets you change your bot's core rules.
- **What It Means For You:** This is total flexibility. You can change your daily trading hours, increase or decrease the max number of signals per day, or set a "cooldown" time between signals. You can adapt your strategy to changing market conditions right from your phone, with no technical setup required.

## Organize Your Signals with /chats

- **What It Does:** This command lets you manage exactly which Telegram channels or groups your signals are sent to. You can easily add new channels or remove old ones.
- **What It Means For You:** Perfect organization for your workflow. You can have a "test" channel to try new strategies, a "main" channel for your members, or even a "VIP" channel for a specific group, all managed from one simple menu.

## Built-in Reliability You Can Trust

- **What It Does:** The bot is smart. If a signal fails to send because of a temporary network glitch or error, the bot doesn't just give up. It automatically tries to send it again a few

times.

- **What It Means For You:** Peace of mind. You can be confident that a temporary hiccup won't cause your important signal to be lost. The system is designed to be reliable and to ensure your signals get delivered.

## Get Help When You Need It

- **What It Does:** Use the /help command to see a quick summary of what you can do. If you ever get stuck in a menu (like /set or /chats), just use the /cancel command to exit and start over.
- **What It Means For You:** You're never lost. Help is always one command away, and you can always safely exit what you're doing.
